The electrostatic force is an an binding force it binds. The proton & the electron

together & make Them to Co-exist.

The Coloumbs law state the electric force btw two charge particle cha
are stationery is proportional to d product of d charge.

> Coloumbs Law

$$F \propto \frac{q_1 q_2}{r^2}$$

B:- Ans Like charges repels while Unlike charges attract.
proportional to d product of d charge the force can be positive or negative

9:- The electron & proton in an hydrogen atom are represented by
$$r = 5.3 \times 10^{-19} m$$

nd d magnitude of d force.

$q^+ \longrightarrow q^x$

$$= \frac{ke|q^+||q^-|}{r^2} = \frac{9.99 \times 10^{-9}(1.60 \times 10^{-19})}{5.3 \times 10^{-11}}$$

$$= 8.2 \times 10^{-8} N.$$

$$3^+ + 1^- = \frac{3^+}{2}$$

$$4^+ + 1^- = \frac{3^+}{2}$$

ELECTROSTATICS

There are two kinds of electric charges, which were given the names positive & negative.

- The charge on an atom is determined by a sub-atomic particles dat made up

- proton: has a positive charge & it is located in d nucleus.
- Neutron: has no charge & is neutral & is also located in d nucleus OSit fusind Spaces b/w d protons.
- Electrons: has a negative charge & it is located outside of d nucleus in an electric cloud around d atom.

PARTICLE CHARGES:

Electron & proton have d same magnitude of charge (elementary charge e).

- Electron $\angle -e \gamma := -1.60 \times 10^{-19} C$
- Proton $\angle +e \gamma := +1.60 \times 10^{-19} C$.
- This is why electron are forced to orbit around d nucleus.
- Electrostatic forces hold atoms 2geth.
- The Law of charges which states dat Like charge repel & unlike charges attract.
- A negatively charged rubber rod suspended by a thread is attached to a posi-vely charged glass rod.
- A negatively charged rubber rod is repelled by another negatively charged rubber rod.
### How do atoms become "Charged"?

*How can this happen?

Remove or add a proton or an electron.

88 protons & neutrons are bound 2gech by a strong nuclear [...]
& it is very hard to separate them. electrons however, can be

more easily removed!

Ions?

An atom with a deficiency of electrons is positively charged.

An atom with an excess of electrons is negatively charged.

NOTE!!! ATOMS DO NOT GAIN OR LOSE PROTONS.

CHARGE IS A FUNDAMENTAL QUALITY LIKE MASS.

*Charge is denoted as q.

*Charge has a fundamental unit of a Coloumb (C).

*charge are usually really really small numbers $\leq 10^{-19}$.

*So what is 1C?

*An object would have to have 6.25×10^{13} extra electrons in amount to [...]
of charge.

* A lightning bolt is estimated to carry a charge of 10e.
* Revisit the charges on an electron & proton.

CHARGES ARE QUANTIZED, CAN ONLY BE IN MULTIPLES OF e.

Remember :- * $-e$ = an electron = -1.60×10^{-19} c.

$+e$ = a proton = $+1.60 \times 10^{-19}$ c.

* An object obt has a net charge of 8.0×10^{-19} c has a net charge of what multiple of e? Hint: How many electron would need to be removed to create this charge?

The net charge would be $+5e$, 5 electrons were removed.

* Two kinds of charges occur in nature, with d property dot unlike charges attract one another & like charges repel are another.
* Charge is Conserved.

* Charge is Quantized.

MULTIPLES OF CHARGES CHARY.

1e	1.6×10^{-19}
2e	3.2×10^{-19}
3e	4.8×10^{-19}
4e	6.4×10^{-19}
5e	8.0×10^{-19}

ELECTROSTATIC FORCE.

This is a non-contact force & like d gravitational force except instead of two masses exerting force on each other the two objects charges exert a force of repulsion or attraction.

* Any charged object can exert the electrostatic force upon other objects- both charged & uncharged object.

ε.

• opposite charged $\frac{1}{4}$ Object with like charges repel
• object attract

COLOUMB'S LAW

Coloumb confirmed dat d electric force b/w two small charged spheres proportional to d inverse square ꟷ their separation distance.

Coloumb's experiments showed that the electric force between the charged particles.

• Is inversely proportional to the square of the seperation between particles and directly along the line joining them.

• Is proportional to the product of the charges q_1 and q_2 for the two particles.

• Is attractive if the charges are of opposite sign and repulsive if the charges have the same sign.

From these observation, we can express coloumb's law equation the magnitude of the electric force (sometimes called the coloumb force) between two point charges.

$$F_e = k_e \frac{|q_1||q_2|}{r^2} \qquad k_e = \frac{1}{9.580}$$

where k_e is a constant called constant $k_e = 8.9875 \times 10^9 \, N \cdot m^2 / C^2$

THE ELECTROSTATICS FORCE

Unlike charges attract

like charges repel
magnitude

$$F_e = k_e \frac{|e|^2}{r^2} = \left(8.99 \times 10^9 \ \frac{N \cdot m^2}{C^2}\right) \left(\frac{1.60 \times 10^{-19} C}{5.3 \times 10^{11} M}\right)$$

$$= 8.2 \times 10^{-8} N.$$

Example of electrostatic forces

• ions have a attractive interaction with a neutral object

• A ballon when rubbed on your head become charged by picking up extra electrons from your hair.

• The same ballon, because it is charged, will attract a neutral objects like pieces of paper.

So we are able to predict the charge on object based on their interaction with other object.
Repulsive interaction Provide convincing evidence that both object must be charged

They can either both be positive or both be negative.

Attraction interaction can lead one to conclude that a least one of the object is charged.

They can have opposite charges or one object is charged and the other is neutral.

Why does the ballon stuck to the wall

• When a ballon is rubbed over a piece of cloth, electrons are transferred b
WHAT HAPPEN TO YOUR HAIR WHEN YOUR RUB A BALLOON ON YOUR HEAD?

- The balloon, after being rubbed and then pived away, removes some of the electrons in your hair which give each strand a positive charge. Like charges want to repel and each strand is repelling from the others and "Standing up".
GETTING SHOCKED.

- As you went across a carpet, electron are transferred from the rug to you.
- Now you have extra electrons.
- Tough a door knob (conductor) and ZAP!
- The electrons move from you to the knob.

LIGHTNING

- Lightning is a realy big shock.
- Positive charges tend to go up, negatively charges tend to go down.
- When the attraction reaches a critical level you get a lightning bolt.

OBJECT that tend to give up electrons and become positive.

* Glass
* Fur
* Wool
* Nylon
* Hair

OBJECT that tend to attract electron and become negative.

* Rubber
* Styrofoam
* PVC
* Polyester
* Saran wrap

INSULATORS AND CONDUCTORS.

Different material hold electrons differently.
- INSULATORS don't let electron move around coming material easily.

e.g. Glass, plastics, Glass, Dry air, wood, Rubber

Conductors:- do let electrons move around within the material freely. e.g metals Silver, Copper, Aluminium.

TRY THIS

- A charged plastics rod is brought close a another metal sphere. How would the distribution of charges be in the metal sphere?
- Which of the diagram below best represents the charged distribution on a metal sphere when a positively charged plastic tube is placed nearby?
LAW OF CONSERVATION OF CHARGE

- Charges within a closed system may be transferred from one object to another, but charge is neither created nor destroyed.

- The diagram below shows the initial charges and positions of three metal spheres, R, S, T on insulating stands.

$-6e$ $-8e$ $+6e$ Note that the net cha-

$-9e$ e $+e$ $-ge$ on the system is $-2e$

$= -2e$
Electrostatic force is a vector quantity.

Thus the Coulomb's law expressed in vector from for the electric force exe-rted by a charge q_1 on a second charged q_2, written F_{12} is

where $\hat{r}$ is a unit vector directed from q_1 to q_2.
Because the electric force obeys Newton's third Laws the electric force exerted by q_2 on q_1 is equal in magnitude to the

Force exerted by q_1 on q_2 and in the opposite direction; hence q_3

$$f_{21} = -f_{12}$$

Example:-

Consider three point charges located at the corner of a right triangle as shown where $q_1 = q_3 = 5.0$, $q_2 = -2.0 \mu c$, & $a = 0.100$. Find the resultant force exerted on q_3.

The magnitude of F_{23} is

$$F_{23} = \frac{ke|q_2||q_3|}{a^2} = \left(8.99 \times 10^9 \frac{N \cdot m^2}{C^2}\right)$$

$$= \left(\frac{2.0 \times 10^{-6} C \times 5.0 \times 10^{-6} C}{(0.10m)^2}\right)$$

The magnitude of the force exerted by q_1 on q_3 is.

$$F_{13} = \frac{ke|q_1||q_3|}{(\sqrt{2}a^2)}$$

$$= \left(8.99 \times 10^9 \frac{N \cdot m^2}{C^2}\right) = \left(\frac{(5.0 \times 10^{-6}C)(5.0 \times 10^{-6}C)}{2(0.10m^2)}\right)$$

$$= 11N.$$

The force F_{13} is repulsive & makes an angle of $45°$ with the x axes. Therefore, the x & y component of F_{13} are equal, with magnitude given by $F_{13}\cos 45°$

$$= 7.9N.$$

The force F_{23} is in the negative x direction. Hence the x & y composition of

d resultant out force acting on q_3 are:-

$$F_{3x} = F_{13x} + F_{23} = 7.9N - 9.0N = -11N.$$

$$F_{3y} = F_{13y} = 7.9N.$$

we can also express d resulting force acting on q_3 is unit vector form
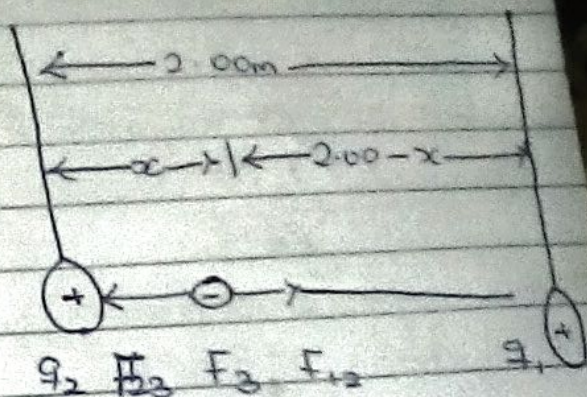

as $F_3 = (-1.1i + 7.9j)N.$

Example:-

Three point charges lie along d x-axis.

The positive charge $q_1 = 15.0\,\mu C$ is at $x = 2.00$.

The positive charge $q_2 = 6.00\,\mu c$ is at d origin.

& d resultant force acting on q_3 is zero.

What is d x co-ordinate of q_3?

$q_2 \overset{F_{23}}{} F_3 \quad F_{13}$
$q_2 \to \ominus \to \qquad\qquad q_1 \oplus$
$\oplus \leftarrow \ominus$

2.00m

$x \to | \leftarrow 2.00 - x \to$

Solution.

Bcos q_3 is negative & q_1 & q_2 are positive, d force F_{13} & F_{23} are both attractive, Hm Colomb b/w F_3 & F_{23} have magnitude.

$$F_{13} = \frac{Ke|q_1||q_3|}{(2.00-x)^2} = F_{23} = \frac{Ke|q_2||q_3|}{x^2}$$

For d resulting force on q_3 to be zero.

e.g: The electron & proton in an hydrogen atom are represented.

$$r = 5.3 \times 10^{-19}M.$$

Find d magnitude of d force!

$$q^+ \to q^x.$$

$$F = \frac{Ke|q^+||q^-|}{r^2} = \frac{8.99 \times 10^{-9}(1.60 \times 10^{-19})}{5.3 \times 10^{-11}}$$

$$= 8.2 \times 10^{-8}N.$$

Electric field & force.

Electric dipoles.

Change particle in ε in Upper poles.

Electric field region whose electric force is expressed as:-

$$F = \frac{1}{4\pi\varepsilon} = \frac{\varepsilon q \cdot r}{r}$$

$$F = \frac{F}{q}$$

$\therefore x$ α d electric field ε

Electric dipoles:- 2 dipp poles carrying different charges e.g water molecules + Cos it contain H^+ & OH^-.
a> Along d axis d dipoles.

b> perpendicular 2 d axis.

Motion of charge particle in ε

$$q\varepsilon = ma$$

$$a = \frac{q}{m}\varepsilon$$

11/04/14: *Charge & electric flux:

→ Gauss law & its application.

* charge & electric flux
The total of the electric flux out of a close surface is equal to the charge enclosed divided by the permitivity. The flux 2ru an area is $\Delta\Phi = E\Delta_A$ <$\Delta\Phi$ change in flux; Δ_A change in area>.

Diagram:-

E <surface area.

<flux> $\Phi = \dfrac{Q}{E_0}$ <charge> <permitivity>

The sum of d flux is proportional 2 d total charge enclosed.

The electric flux 2ru an area is defined as d electric field multiplied by d area of d surface projected in a plane perpendicular 2 d field.

& Guass law is general law applying 2 any close surface"

* Guass Law integral;

$$\oiint \vec{E}\cdot\vec{dA} = \dfrac{Q}{E_0}$$

The area of d electric field over any closed surface is equal 2 d nett charge enclosed in d surface divided by d permitivity of space

"Guass law is a form of one of maxwells equation, the four fundamental equation for electric & magnetism.

ELECTRIC FLUX.

The concept of electric flux is useful in association with Gauss's law. Electric flux thru a planar is defined as the electric field multiplied by component of d area perpendicular 2 d field. If d area is not a plane then d evaluation of d flux generally requires an area integral since d angle will be continually changing.

$$Flux = \phi = E_A \cos\theta.$$

Relative permittivity $= \varepsilon_r = \dfrac{\varepsilon}{\varepsilon_0}$
The angle btw d electric field & d area is θ.
perpendicular
lar 2 d area.

$$\phi = \int E \cos\theta \, dA.$$

* $10^{-12} \rightarrow$ pico.

When d area A is used in a vector operation like this, it is understood that d magnitude of d vector is equal 2 d area & d direction of d vector is perpendicular 2 d area.

ε_r = permitivity of a medium (dielectric).

$\varepsilon_0 = 8.85 \times 10^{-12}$ F/m

Application of Guass Law.

It is a powerful tool for Calculation of electric field when they originate from Charge distribution of sufficient symmetry

conducting Sphere.

Conducting cylinder

Charge in surface Conductor

Sphere with Uniform Charge density.
Cylinder with uniform charge density
Charge Conducting plates.

Ass:

Write four maxwell's equation.

Solution:

Maxwell's equation are:- i) Guass law.

ii) Faraday's law.

iii) Electro magnetic Induction law.

iv) Ampere's law.

Dr. Hammed olaide Sakirudeen

18/03/17: ELECTRIC POTENTIAL.

the potential in

Electric potential means taking a charge from a particular point 2 another within an electric circuit.

$$F = QE$$

$$\therefore E = \frac{F}{Q}$$

$$\Delta V = \frac{\Delta U}{Q}$$

where, Q - charge.

U = change in electric potential energy.

V = change in electric potential.

Equipotential surfaces: It is a set of point where the electric potential energy

that as given in the value.

* Find the from V

$$E_x = \frac{-\Delta V}{\Delta x} , E_y = \frac{\Delta V}{\Delta y} , E_z = \frac{\Delta V}{\Delta z}$$

potential of a point charge & Groups of point charges

* When y differentiate electric potential is Electric field.

$$V = \frac{q}{r}$$

potential due to a continuous charge distribution.
potential energy of system of charges.

problems:

1. The electric potential difference b/w the ground & a cloud in a particular thunderstorm is $1.2 \times 10^9 V$. What is the magnitude of change in energy (in multiples of the electron volt)?

Soln.

$$\Delta v = \frac{\Delta u}{q}$$

$$\Delta u = q \times \Delta v$$
$$= 1.6 \times 10^{19} \times 1.2 \times 10^9 V$$
$$= 1.2 \times 10^9 eV.$$

2. An infinite non conducting street has a surface charge density $\delta = 0.10 Ne/m^2$ on one side. How far apart are equipmental surface whose potential differ by 50 volts?

3. Two large parallel conducting plates are 1ocm apart & have charges of equal magnitude & opposite sign on dat facing surface. An electrostatic force of 3.9×10^{-12} act on an electron.

The electron potential at a point in a plate is given by $V = 2x^2 - 3y$. What are d magnitude & direction of d electric field at the poi

$\int \vec{E} \, d\vec{l}$

differentiate $(2x^2 - 3y^2)$

$$= 2 \times 2x^{2-1} - 2 \times 3y^{2-1}$$

$$= 4x - 6y \qquad \dot{L} = \frac{dH}{dt} = 4x - 6y \quad (3)(2)$$

$\varepsilon = \frac{\Delta U}{q}$

where x is 3 & $y = 2$

$$= 4(3) - 6(2)$$

$$= 12 - 12 = 0$$

magnitude $\varepsilon = \sqrt{12^2 + (-12)^2}$

$$= \sqrt{144 + 144}$$

$$= \sqrt{288}$$

25/07/17. CONDUCTORS & CURRENT: ELETRIC CURRENT, RESISTORS & RESISTANCE
ELETRIC POWER.

Electric Current is a quantity of charges that flow in a wire or in a conductor or in a circuit per second.

Conductor allows electric current to pass through them easily.

Insulation doesn't allow electric current to pass 2ru them.

※ The gap btw valence bar & the Conductor bar is called energy gap.

$$\underset{V_B}{\overline{\underset{CB}{}}} \longrightarrow \text{energy gap}$$

resistance

Super Conductor offer no conductor to the flow of Current & The resistance is zero dut.

electric Current $= \underset{t \, i_s}{\underbrace{\lim \frac{q_{(c)}}{t_{(s)}}}}$

$q = it$ ist.

electric current is measured in ampere.

Unit of Current $i(A) = \frac{c}{s}$ 1S%.

1 ampere $= 10^{-6} \mu A / 10^{-3} mA$.

$i = \frac{dq}{dt}$

$dq = i dt$

$q = \int_0^t i dt$

Current density is the quantity of charge per unit area. That passes

$$j = \frac{I}{area} \left\{ \frac{A}{m^2} \right\}$$

*Lighter object has high density than heavier object.

Resistivity is define as the ratio of electric field per Current density. $P = \frac{E \langle Electric\ field \rangle}{J \langle Current\ density \rangle}$

$= \frac{V}{L} = \frac{V}{L} = \frac{A}{I}$

$\quad \frac{I}{A}$

$V \alpha I$ \qquad $slope = \frac{\Delta v}{\Delta I} = P$

$V = IR$.

$P = \frac{RA}{L}$

Resistance $= R \alpha L$.

$\therefore P \alpha \frac{1}{A}$.

$R \alpha \frac{1}{A}$.

$R = \frac{PL}{A}$

$\therefore P = \frac{RA}{L}$.

Conductivity:-

$$O = \frac{1}{P} \quad (\Omega^{-1}m^{-1}) \quad \text{unit}$$

$$P = \frac{\vec{E}}{\vec{J}}$$

$$\frac{I}{O} = \frac{\vec{E}}{J}$$

$$\Rightarrow \gamma J = \vec{E}$$

* Fixed resistor are resistor with wholeno value. eg 1, 2, 3, 4, 5. . -etc

* Variable resistor are resistor are which resistance can be varied

→ Arrangement of resistors: series &-

parallel.

$$\vec{I}_0 = i_1 + i_2 + i_3$$

or $\vec{I}_0 - I_1 - I_2 - I_3 = 0$

series arrangement:

Group 1 = ABCFA

Group 2 = CAEFC

Group 3 = ABCDEF

$$V_1 = IR_1$$
$$V_2 = IR_2$$
$$V_3 = IR_3$$
$$V = V_1 + V_2 + V_3$$
$$IR = IR_1 + IR_2 + IR_3$$

$$IR = I(R_1 + R_2 + R_3).$$

Combine resistance, equivalent resistance or total Resistance

$$R_T = R_1 + R_2 + R_3.$$

Parallel arrangement of resistors

$$I_0 = I_1 + I_2 + I_3$$

$$V = IR, \Rightarrow I = \frac{V}{R_T}$$

$$V = I_1 R_1 \Rightarrow I_1 = \frac{V}{R_1}$$

$$V = I_2 R_2 \Rightarrow I_2 = \frac{V}{R_2}$$

$$V = I_3 R_3 \Rightarrow I_3 = \frac{V}{R_3}$$

$$V = IR$$

$$I = \frac{V}{R}$$

$$\frac{V}{R_T} = \frac{V}{R_1} + \frac{V}{R_2} + \frac{V}{R_3}$$

$$V\left(\frac{1}{R_T}\right) = V\left(\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}\right)$$

$$\frac{1}{R_T} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

★ Electric Conductance.

Joules law of electric Current
$$H \propto I^2$$

$$H \propto R \qquad H = I^2 R t$$

$$Power = I V = I(IR) = I^2 R$$

$$P = I V$$

$$I = \frac{V}{P} = \frac{V}{R} \times V = \frac{V^2}{I^2}$$

Example 1. A square block of alloy has dimension 1.5cm by 1.5cm by 1.5cm by 1.5cm. A potential difference is to be applied between the alloy block and a _____, So that both Size are equipotential Surfaces, take resistivity to be $9.6 \times 10^{-6} \Omega m$.

2 the resistivity of a broken piece of broken wire of length 3cm is $5.4 \times 10^{-7} \Omega m$, If the Cross sectional area of the wire is $9.5 \times 10^{-3} m^3$, Cal. the resistance of the wire.

3. Determined resistivity or equivalent resistance of the Circuit below

Hence
R_2 is the same with R_3!

$$R_{11} = 3\Omega + 3\Omega = 6\Omega$$

$R_4, R_5 \& R_6$ are in dence.

$$R_{12} = R_4 + R_5 + R_6$$
$$= 3\Omega + 3\Omega + 3\Omega = 9\Omega$$

$\therefore R_{11} // R_{12}$

$= \frac{1}{R_{12}} = \frac{1}{R_{11}} + \frac{1}{R_{12}} = \frac{1}{6} + \frac{1}{9}$

$= \frac{3 + 2}{18} = \frac{5}{18} //$
